

Our company was founded in 1983, supplying and manufacturing products in the field of locks and security systems for safes. For over thirty years, Tecnosicurezza has been at the forefront of development and design, collaborating with multiple industry partners to raise standards, refine technology and expand features.

Our mission is to use our experience to meet the challenging and changing needs of the market, adapting and developing the best technology available, to provide a complete solution for our customers.

As well as being certified to ISO9001, we continuously ensure that our business operations are held to the highest standard. Ongoing technical training and development, a dedicated R&D department and investment in advanced assembly and testing equipment has also allowed us to be recognised as a “manufacturing plant for Vds approved products according to Vds 2344”

# Sales & Service

Sales & Service

Our sales team and worldwide distribution network focus on providing expert product and security advice for a range of projects. We attend conferences, exhibitions and fairs, where we share our knowledge, and keep ourselves informed of the needs of the banking, retail, leisure, homeowner and public sectors. Our after-sales service and support programme includes extensive training, which we deliver at customers' premises without charge.

# Products

Products

Our full range of security systems are Vds and UL certified, ensuring compliance with insurance, security and safety standards recognised throughout the world. Our locks are of standard footprint, and can be retrofitted to any safe, installation and setup is quick and easy.

As well as the typically attractive and elegant Italian design appreciated by clients, our lock systems have been developed with ease of use in mind. The operation of every system is simple and intuitive; making Tecnosicurezza locks the most versatile and most manageable solution for any project.

# Customisations

As a Vds and UL approved manufacturer, we have the technical certification to ensure our products meet with the highest standards of safety and security. Our passion for design and development ensures the highest standards of quality. These elements combined allow us to meet with the challenges presented by customers for new and advanced features.

## Examples of customisation for Banks:

- **Alarm signal settings:** Upon receipt of communication from an alarm system, the lock system parameters will switch to pre-configured high security settings, such as increased time delay, to further protect the safe or vault.
- **Supervisor authorisation:** To disable all user codes until they have been authorised and enabled by a Supervisor when the bank opens. The Supervisor may again disable all codes when the bank closes for the day to prevent unauthorised access outside of usual opening times.
- **Automatic closing:** For a motorbolt lock to close automatically to prevent users from forgetting to close the lock. If the bolt is held in position with boltworks, the lock will spring closed when the boltworks are released.
- **Full audit:** To increase the range of recorded audit events to include manager functions such as adding users, so that any configuration of the lock system can be monitored.

## Examples of customisation for Retail Businesses:

- **Dual mode for handover:** To require two user codes to open the safe during the shift handover period so that the contents of the safe can be checked by two people. For the same business, to disable all other user codes except for the staff working each shift.
- **Seasonal Timelock:** For timelock settings to automatically change at certain times of the year depending on the operational needs of the business.

## Examples of customisation for CIT (Cash in Transit, Cash Couriers)

- **PIN for dynamic code users:** For one-time code or "dynamic code" users to have a PIN (Personal Identification Number) rather than a Dallas key with their dynamic code to prevent loss or misuse of Dallas keys.
- **Cash monitoring:** For the lock system to register the addition and removal of sealed cash bags, so that the movement of cash can be remotely monitored and managed.

Our sales team and distribution network have the expertise and energy to work closely with businesses, managing a range of access control needs for safes and vaults. This ensures protection and operational efficiency for our many customers.
